                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (regulatory) subunit.

SUBCELLULAR LOCATION: Cytoplasmic; Translocates to the plasma membrane upon Ca++ binding (By similarity).

SIMILARITY: Contains 5 EF-hand calcium-binding domains.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2; ALSO KNOWN AS THE CALPAIN FAMILY OF THIOL PROTEASES.

```
Arg-1-Xaa with Leu or Val as the P2 residue.

-!- ENZYME REGULATION: Activated by micromolar concentrations of calcium and inhibited by calpastatin.
-!- SUBUNIT: Heterodiner of a large (catalytic) and a small (regulatory) subunit.
-!- SUBUNIT: Heterodiner of a large (catalytic) and a small (regulatory) subunit.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- TISUE SPECITICING: 3 ISOFORMS; I (SHOWN HERE), II AND III; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECITICITY: SKELETAL MUSCLE.
-!- DISEASE: DEFECTS IN CAPN3 ARE THE CAUSE OF LIMB-GIRDLE MUSCULAR DYSTROPHY TYPE 2A (LGMD2A). LGMD2A IS BOTH AUTOSOWAL DOMINANTLY AND RECESSIVELY TRANSHITTED. IT IS CHARACTERIZED BY PROGRESSIVE SYMMETRICAL ATROPHY AND WEAKNESS OF THE PROXIMAL LIMB MUSCLES AND ELEVATED SERUM CREATINE KINASE. THE SYMPTOMES USUALLY BEGIN DURING THE FIRST TWO DECADES OF LIFE, AND THE DISEASE GRADUALLY WORSENS, OFTEN RESULTING IN LOSS OF WALKING ABILITY 10 OR 20 YEARS AFTER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VARIANT LGMD2A GLY-744.

FUNCTION:

18:6880-6889(1999)

of

basis

enzyme

Calcium-regulated

EVACTION: Calclum-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction.

CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xa.

cleavage:

Tyr-|-Xaa,

Met-|-Xaa

or

activation.

Arg-1-Xaa with Leu or Val as the P2 residue.
COFACTOR: Binds 3 calcium ions.
ENZYME REGULATION: Activated by 200-1000 micromolar concentrations
of calcium and inhibited by calpastatin.
SUBUNIT: Heterodimer of a large (catalytic) and a small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ydrolase; Thiol protease; Calcium-binding; Repeat; Multigene family;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DECREASE OF 12% OF THE ACTIVITY
                                                                                                                                                 membrane upon Ca++ binding.
SIMILARITY: CONTAINS 5 EF-HAND CALCIUM-BINDING DOMAINS.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2; ALSO KNOWN AS THE CALPAIN FAMILY OF THIOL PROTEASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NO EFFECT.

Nakagawa K:, Irie A., Sorimachi H., Bourenkow G. X., Marunik H., Suzuki K., Bode W.;

"The crystal structure of calcium-free human m-calpain suggests an electrostatic switch mechanism for activation by calcium.",

Proc. Natl. Acad. Sci. U.S.A. 97:588-592(2000).

-I-FUNCTION: Calcium-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction.

-I- CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa Afg-|-Xaa with Leu or Val as the P2 residue.

-i- COFACTOR: Binds 3 calcium ions.

Biol. Chem. 254:20106-20111(1989).
-!- FUNCTION: Calcium-regulated non-lysosomal thiol-protease.
-!- CATALIYIT CACIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa Arg-|-Xaa with Leu or Val as the P2 residue.
-!- ENZYME REGULATION: Activated by micromolar concentrations of calcium and inhibited by calpastatin.
-!- SUBUNIT: Heterodimer of a large (catalytic) and a small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE-90062125; PubMed-2555341; Sorimachi H., Imajoh-Ohmi S., Emori Y., Kawasaki H., Ohno S., Minami Y., Suzuki K.; Minami Y., Suzuki K.; Molecular cloning of a novel mammalian calcium-dependent protease distinct from both m- and mu-types.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            428
                                                                                                                                                                     CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa or Arg-|-Xaa with Leu or Val as the P2 residue.

COFACTOR: Binds 3 calcium ions.

ENZYME REGULATION: Activated by 200-1000 micromolar concentrations of calcium and inhibited by calpastatin.

SUBUNIT: Heterodimer of a large (catalytic) and a small
                      (regulatory) subunit.
SUBCELLULAR LOCATION: Cytoplasmic; Translocates to the membrane upon Ca++ binding.
SIMILARITY: CONTAINS 5 EF-HAND CALCIUM-BINDING DOMAINS SIMILARITY: BELONGS TO PERTIDASE FAMILY C2; ALSO KNOWN
                                                                                                                                                                                                                                                                                                                                    FUNCTION: Calcium-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction (By similarity). CATALYTIC ACTIVITY: Preferential cleavage: Tyr-|-Xaa, Met-|-Xaa

                                                                                                                                                                                                                                                                                                (regulatory) subunit.
-:- SUBCELLUIAR LOCATION: Cytoplasmic and nuclear (Potential).
-:- TISSUE SPECIFICITY: SKELETAL MUSCLE. LOW LEVELS IN SPLEEN,
INTESTINE AND BONE.
-:- SIMILARITY: CONTAINS 4 EF-HAND CALCIUM-BINDING DOMAINS.
-:- SIMILARITY: BELONGS TO PEPTIDASE FAMILY C2; ALSO KNOWN AS THE CALPAIN FAMILY OF THIOL PROFEASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ANCESTRAL CALCIUM SITE 3 (POTENTIAL)

N;Alternate names: m-calpain heavy chain

C;Species: Gallus gallus (chicken)

C;Date: 28-Oct-1995 #sequence_revision 03-Nov-1995 #text_change 20-Jun-2000

C;Accession: S57194

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Method for screening for type 2 diabetes mellitus comprises detecting a

us-09-768-877-2.sep19.rag

The present sequence is that of a novel human cysteine protease, designated calpain 10a. The protein is encoded by the major transcript (see AAAZ7476) of the human calpain 10 gene, CAPN10 (see AAZ7475), which has been identified in the NIDPM1 region of chromosome 2. The CAPN10 gene consists of 15 exons spanning 32 kb. chromosome 2. The CAPN10 gene consists of 15 exons spanning 32 kb. a complex pattern of alternative splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see Invention concerns the identification of genes responsible for type 2 diabetes responsible for type 2 diabetes responsible for type 2 diabetes responsible for cype 2 diabetes responsible for shows evidence for linkage to type 2 diabetes. Claimed methods for snew softence for linkage to type 2 diabetes mellitus are based con detection of a polymorphism in a calpain encoding nucleic acid, especially ucsney of the CAPN10 gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding colympletide such as calpain activity using calpain 10 polypeptides: and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated glucose transport.  $\operatorname{polymorphism}$  in a calpain encoding nucleic acid segment or protease-encoding nucleic acid segment -Claim 40; Page 217-219; 257pp; English.

It is encoded by cDNA identified in Incyte clone 1902576 derived from OVARNOTO7 CDNA library. Anti-PPRG antibodies can be used as therapeutic antagonists, reagents for diagnosis and monitoring diseases and for isolating PPRG. PPRG nuclectide sequence can be used as probe or primer for diagnosis and monitoring of PPRG-related diseases and gene mapping. PPRG can be used in the treatment of cell proliferative disorders like cancer, arteriosclerosis, atherosclerosis, addison's disease, adult respiratory distress syndrome, allergies, addison's disease, adult respiratory distress syndrome, allergies, ankylosing spondylitis and amyloidosis.

                clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                       08-JUL-1999;

The present sequence is that of murine calpain 10 (or diapain-1), a novel cysteine protease encoded by the major transcript of the CAPNIO gane (see AAAZ1484). Calpain is ubiquitously expressed in mouse and humans. The invention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therefore (see AAAZ1475) shows evidence for linkage to type 2 diabetes. Claimed methods for screening for a propensity for type 2 diabetes are based on detection of a polymorphism in a calpain canciding nucleic acid. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding polymuclectides. Calpain 10 polypeptides using calpain 10-encoding polymuclectides. Calpain 10 polypeptides using calpain 10 encoding cactivity using calpain 10 polypeptides will particular through the regulation of an insulin secretory response or insulin mediated

The invention relates to polypeptide and polynucleotide of calpain-like CC protease, 18036. The polypeptide and polynucleotide of the invention are CC useful for treatment and diagnosis of calpain-like protease-mediated CC disorders. These disorders include disorders of spleen (e.g. disorders. These disorders include disorders of spleen (e.g. polynomegaly), lung (e.g. adult respiratory distress syndrome), colon CC (e.g. disopathic inflammatory bowel disease), liver (e.g. jaundice), CC brain (e.g. traumatic brain injury, cerebral oedema, cerebrovascular CC disease, acute meningitis, Alzheimer's disease), T-cells (e.g. transplant CC rejection, systemic lupus erythematosus), skin (e.g. sebornhoeic CC keratoses), haematopoietic stem cells (e.g. leukaemias), heart (e.g. cC myocardial infarction, atherosclerosis), kidney (e.g. acute proliferative CC glomerulonephritis, urolithiasis), thymus, breast, testis, uterus, cepididymis, endometrium; prostate, thyroid, skeletal muscle, pancreas, CC small intestine, disorders related to reduced platelet number, bone, CC ovary, pain and infectious disorders. The molecules of the invention are also useful for diagnosing and treating disorders associated with CC perturbed cellular growth and differentiation, exercise-induced injury CC demyelinating diseases including experimental allergic encephalomyelitis (EAE) and multiple sclerosis, Lomba neurodegenerative diseases, cancer and cell death associated with diverse toxicants. The present sequence consumed to between DSS140 and DSS2338.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New calpain-like protease polypeptides and polynucleotides for diagnosing, treating seven-transmembrane protein/receptor-related disorders and to identify modulators of therapeutic use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim

readily detectable in many tissues, including skeletal muscle and islets. The invention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A G-to-A polymorphism in intron 3 of the CAPNIO gene (UCSNP-43) shows evidence for linkage to type 2 diabetes. Claimed methods for screening for a propensity for type 2 diabetes mellitus are based on detection of a polymorphism in a 2 diabetes mellitus are based on detection of a polymorphism in a 2 calpain encoding nucleic caid, especially UCSNP-10 of the CAPNIO gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding polynucleotides; regulating 2 diabetes by providing a calpain 10-encoding polynucleotides; regulating 2 diabetes by providing a calpain polypeptide such as calpain 10; polypeptides; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response
                                                                                                                                                                                             The present sequence is that of a novel human cysteine protease, designated calpain 10b. The protein is encoded by a transcript (see AAA2747) of the human calpain 10 gene, CARN10 (see AAA2747) which has been identified in the NIDDM1 region of chromosome 2. The CARN10 gene consists of 15 exons spanning 32 kb. A complex pattern of alternative splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), designated calpain 10a to 10h, respectively. Calpain 10b is
                                                                                                                                                                                                                                                                                                                            Claim 40; Page 220-222; 257pp; English.
                                                                                                                                                                                                                                                                                                                                                   Method for screening for type 2 diabetes mellitus comprises detecting polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment -

Method for screening for type 2 diabetes mellitus comprises detecting a polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment -Threates out and the teacher of genes responsible for type of diabetes for use in diagnostication of genes responsible for type of diabetes for use in diagnostic and therapeutic applications. A construction of polymorphism in intron 3 of the CAPNIO gene (UCSNP-43) shows evidence for linkage to type 2 diabetes. Claimed methods for creening for a propensity for type 2 diabetes mellitus are based of diabetes of a polymorphism in a calpain encoding nucleic acid, especially UCSNP-10 of the CAPNIO gene. Methods are also claimed for: producing calpain 10 polymorptides using calpain 10-encoding polymorlectides; regulating diabetes by providing a calpain oplymorptide such as calpain 10 polymorptides; identifying modulators of calpain activity using calpain 10 polymorptides; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated glucose transport. The present sequence is that of a novel human cysteine protease, designated calpain 10d. The protein is encoded by a transcript (see AAA27479) of the human calpain 10 gene, CAPN10 (see AA27475), which has been identified in the NIDDM1 region of chromosome 2. The CAPN10 gene consists of 15 exons spanning 32 kb. A complex pattern of alternative splicing generates proteins of 672, 544, 6517, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), designated calpain 10a to 10b, respectively. Calpain 10d is expressed only at 10v levels in the tissues examined. The Otan1 K; Zhou Y, Sreenan S, Claim 40; Page 225-227; 257pp; English. oda N, WPI; 2000-339702/29. The present sequence is that of a novel human cysteine protease, designated calpain 10e. The protein is encoded by a transcript (see AAA7480) of the human calpain 10 sene, CAPRIO (see AA27480) of the human calpain 10 sene, CAPRIO (see AA27475), which has been identified in the NIDDMI region of chromosome 2.

The CAPNIO gene consists of 15 exons spanning 32 kb. A complex pettern of alternative splicing generates proteins of 672, 544, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), designated calpain 10a to 10h, respectively. Calpain 10e is cypressed only at low levels in the tissues examined. The invention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A c-to-A-pulymorphism in intron 3 of the CAPRNO gene (UCSNP-43) shows evidence for linkage to type 2 diabetes. Claimed methods for screening for a propensity for type 2 diabetes mellitus are based of decrease in a calpain encoding nucleic acid, especially UCSNP-10 of the CAPRNO gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding polypeptide such as calpain 10e; identifying modulators of calpain coling calpain 10 polypeptides; and using these modulators contractory reserves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Method for screening for type 2 diabetes mellitus comprises detecting polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment -

The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, Hry and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhinitis, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, Parkinson's disease, neurodegenerative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cells they are expressed in, such as: antiinflammatory; antirheumaticantiarthritic; immunosuppressive; antibacterial; endocrine; cardiant central nervous system; virucide; anti-HTV; fungicide; antimutagen; cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary; antilicer; osteopathic; dermatological; antialiergic; antiasthmatic;
                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                neurological disorders.

The present sequence is that of a novel human cysteine protease, designated calpain 10f. The protein is encoded by a transcript (see AAZA7481) of the human calpain 10 gene, CARNIO (see AAZ7475), which has been identified in the NiDDMI region of chromosome 2.

"The CARNIO gene consists of 15 exons spanning 32 kb. A complex pattern of alternative splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), expressed only at low levels in the tissues examined. The invention concerns the identification of genes responsible for type civention concerns the identification of genes responsible for type civention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A general propensity for type 2 diabetes mellitus are based confection of a polymorphism in a calpain encoding nucleic acid, especially UCSNP-10 of the CARNIO gene. Methods for acid especially UCSNP-10 of the CARNIO gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding colympatics such as calpain 10; identifying modulators of calpain activity using calpain 10 polypeptides; and using these modulators to respect transport.
                                                                                                                                                                                                                                                                                                                                detecting a

The invention relates to novel human polynucleotides encoding protein

(NHP) that share sequence similarity with human calcium dependant

proteases. Nuclocided constructs encoding functional NHPs are used in

gene therapy for the modulation of NHP expression. NHP oligonucleotides

can be used as hybridization probes for screening libraries and assessing

the expression patterns. The sequences may also be used as part of

ribozyme and/or triple helix sequences that are useful for NHP gene

regulation. Labeled NHP nucleotide probes can be used to screen a human

genomic library. The NHP nucleotide sequences are also useful in drug

screening techniques. Nucleotide constructs encoding NHP products can be

used to genetically engineer host cells to express NHP products in vivo,

these genetically engineered cells function as bioreactors in the body,

delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion

protein to the body. The present sequence represents a NHP.
                                                                                                                                                                                                                                                                                                                                                                                                          Sands AT;
                                                                                                                                          Novel human protein; NHP; calcium; protease; gene therapy; screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human polynucleotides isolated from human testis cDNA library, encodes novel human proteins, useful as reagents in screening for compounds used for treating mental and biological disorders -
                                                                                                                                                                                                                                                                                                                                                                                                      Zambrowicz B,

```

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397. which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary.

The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupu erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an OREX associated disorder. The

```
The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hemmatopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or transmentance.
Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding polypeptides with cytokine-like activities,

```

The invention relates to novel human polynucleotides encoding protein (NHP) that share sequence similarity with human calcium dependant proteases. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression. NHP oligonucleotides can be used as hybridization probes for screening libraries and assessing NHP gene expression patterns. The sequences may also be used as part of ribozyme and/or triple helix sequences that are useful for NHP gene regulation. Labeled NHP nucleotide sequences are also useful in drug genemic library. The NHP nucleotide sequences are also useful in drug screening techniques. Nucleotide constructs encoding NHP products can be used to genetically engineer host cells to express NHP products in vivo, these genetically engineer dells function as bioreactors in the body, delivering a continuous supply of a NHP, a NHP peptide, or a NHP fusion protein to the body. The present sequence represents a NHP Claim 6; Page 31-33; 39pp; English.
